Magnetic Line - A smooth way of structuring balloons. Draw a line which the balloons will snap to and be placed nicely along the line.

AutoBalloon - Automatically assigns balloons to all components (but does not assign balloons to the parts that are the same).

Pattern type:

Move dimensions between views - Shift+Drag dimension to other view.

Move parent and projected views as one - Shift+Drag parent view.

Import dimensions (annotations and reference geometry) automatically - Click on view and choose *Model Items* in the Annotation tab toolbar.

Auto arrange dimensions - Creates a good structure on dimensions. Mark the dimensions, hold the mouse pointer over the small dimension symbol that appears at the right of the mouse pointer. Choose *Auto Arrange Dimensions*.
